Corvane Pay - Reliability report Q1 2026

Prepared by Engineering Management on 2 April 2026.

Availability of card payments in Q1 2026 was 99.94%, below the target of 99.95%. Two incidents caused most of the downtime in the quarter.

INC-2017 (9 February 2026): wallet payments were unavailable for 22 minutes after a faulty configuration change in the wallet service. The change was rolled back at 09:41 UTC. Card payments were not affected.

INC-2041 (14 March 2026): card payments failed for 47 minutes because of an expired TLS certificate on the internal payment gateway. 18% of card transactions failed during the incident. The certificate is now covered by automated renewal.

Goals for Q2 2026: alerts for expiring certificates, a status page update within 10 minutes of detection, and card payment availability of at least 99.95%.
